Prof. Herdt's reflections on virtue make us think about two features of human beings.

First, human beings are capable of ethical habits, i.e., stable dispositions allowing for excellent actions. In that regard, human beings share with other natural systems an autonomy through which they act over their environment but do this in a human-specific way, namely, developing human habits by freely choosing their goals in life. Virtues and free will thus go hand in hand.

Second, all scientific progress ultimately depends on scientists sharing virtues like truthfulness, industriousness, and humbleness. Science is built by virtuous people.
